INVESTOR IN PEOPLE

The Patent Office  
Concept House  
Cardiff Road  
Newport

South Wales NP10 8QQ	REC'D 22 OCT 2004
WIPO	PCT

**PRIORITY  
DOCUMENT**  
SUBMITTED OR TRANSMITTED IN  
COMPLIANCE WITH RULE 17.1(a) OR (b)

I, the undersigned, being an officer duly authorised in accordance with Section 74(1) and (4) of the Deregulation & Contracting Out Act 1994, to sign and issue certificates on behalf of the Comptroller-General, hereby certify that annexed hereto is a true copy of the documents as originally filed in connection with the patent application identified therein.

In accordance with the Patents (Companies Re-registration) Rules 1982, if a company named in this certificate and any accompanying documents has re-registered under the Companies Act 1980 with the same name as that with which it was registered immediately before re-registration save for the substitution as, or inclusion as, the last part of the name of the words "public limited company" or their equivalents in Welsh, references to the name of the company in this certificate and any accompanying documents shall be treated as references to the name with which it is so re-registered.

In accordance with the rules, the words "public limited company" may be replaced by p.l.c., plc, P.L.C. or PLC.

Re-registration under the Companies Act does not constitute a new legal entity but merely subjects the company to certain additional company law rules.

Signed

*P. Mahoney*

Dated 13 October 2004

**Warning**

After an application for a patent has been filed, the Comptroller of the Patent Office will consider whether publication or communication of the invention should be prohibited or restricted under Section 22 of the Patents Act 1977. You will be informed if it is necessary to prohibit or restrict your invention in this way. Furthermore, if you live in the United Kingdom, Section 23 of the Patents Act 1977 stops you from applying for a patent abroad without first gaining written permission from the Patent Office unless an application has been filed at least 6 weeks beforehand in the United Kingdom for a patent for the same invention and either no direction prohibiting publication or communication has been given, or any such direction has been revoked.

**Notes**

- a) If you need help to fill in this form or you have any questions, please contact the Patent Office on 08459 500505.
- b) Write your answers in capital letters using black ink or you may type them.
- c) If there is not enough space for all the relevant details on any part of this form, please continue on a separate sheet of paper and write "see continuation sheet" in the relevant part(s). Any continuation sheet should be attached to this form.
- d) If you have answered 'Yes' Patents Form 7/77 will need to be filed.
- e) Once you have filled in the form you must remember to sign and date it.
- f) For details of the fee and ways to pay please contact the Patent Office.

Patents Form 1/7

1 IMPROVED FORMULATION FOR PROVIDING AN ENTERIC COATING  
2 MATERIAL

3

4 The present invention relates to a formulation for  
5 providing an enteric coating material and in particular  
6 relates to such a material made up of food use approved  
7 materials.

8

9 In many cases it is a requirement of pharmaceutical and  
10 nutraceutical dosage units that they are able to pass  
11 through the stomach intact and only release their  
12 contents further down the GI Tract. This is necessary  
13 when a particular ingredient (or ingredients) of the  
14 dosage unit is unstable in the strongly acidic  
15 environment of the stomach and where the ingredient or  
16 ingredients are intended for release in the slightly  
17 alkaline conditions of the GI Tract beyond the stomach.

18

19 The prior art shows many cases where pharmaceutical  
20 dosage units achieve the abovementioned requirement using  
21 an enteric coating. Enteric coating materials are  
22 material types that are acid resistant, protecting and  
23 preventing the dosage unit from a releasing of the

1 contents into the stomach. However, these coatings  
2 dissolve or disintegrate in the neutral or mildly  
3 alkaline conditions that are encountered beyond the  
4 stomach. In the pharmaceutical industry enteric coatings  
5 are widely used, with a wide choice of enteric materials  
6 such as hydroxypropyl methylcellulose phthalate (HPMCP),  
7 methacrylic acid/methyl methacrylate copolymers (for  
8 example Eudragit <sup>™</sup> materials), cellulose acetate  
9 phthalate (CAP) and polyvinyl acetate phthalate (PVAP).  
10 All of these enteric materials have been developed over a  
11 considerable period to provide a wide range of organic  
12 solvent soluble materials or aqueous dispersions which  
13 have both excellent coating and enteric properties.  
14 However, manufacturers have had to invest heavily to gain  
15 approval for the use of their materials in the  
16 pharmaceutical industry and rigorous testing of the  
17 materials has been required. Although, all of these  
18 products have been through this pharmaceutical approval  
19 route, they have not been considered as viable  
20 propositions for companies to devote similar significant  
21 resources to gain approval for use in the food industry.  
22 Therefore, although these materials are appropriate  
23 enteric materials they are not approved for food use and  
24 cannot legally be used to enteric coat non-pharmaceutical  
25 dosage units. It can be seen that there would be many  
26 cases when it would be useful to provide enteric coatings  
27 on items that are non-pharmaceutical dosage units, for  
28 example for certain health foods etc.

29

30 There are in fact very few materials that are both  
31 approved for food use and have been suggested or used as  
32 enteric coatings. One possible material that has been  
33 suggested is Shellac. Shellac is an exudate of the lac

1 insect and is a natural material that is insoluble in  
2 water but soluble in organic solvents including ethanol.  
3 It has been used as a sealing coat on tablet cores, as a  
4 food glaze and also as a type of enteric coating. As  
5 Shellac is insoluble in acidic conditions but soluble at  
6 higher pH levels it would appear to be suitable as an  
7 enteric coating material. However, reference texts  
8 describe that, in practice, delayed disintegration and  
9 delayed drug release occurs in vivo as the Shellac coat  
10 is not soluble in the upper intestine. Laboratory trials  
11 in this case have now shown that Shellac does not behave  
12 in a typical enteric coating manner and instead behaves  
13 more like an erodible coating, dissolving as a function  
14 of time rather than of pH.

15  
16 Traditionally, Shellac coats have been sprayed from an  
17 organic solution, a disadvantage in terms of solution  
18 cost and environmental protection cost. It is possible  
19 to spray Shellac from an aqueous solution after forming  
20 the Shellac into a water soluble alkali salt, and aqueous  
21 Shellac salt solutions are commercially available. These  
22 commercially available solutions form films that dissolve  
23 in neutral or mildly alkaline conditions and appear, at  
24 first consideration, to overcome the alkaline  
25 insolubility problem of Shellac sprayed from organic  
26 solution. However, unfortunately these films react  
27 rapidly in acid to revert to the free acid Shellac and,  
28 when ingested as a film of a dosage unit, the acidic  
29 conditions in the stomach restore the film to Shellac and  
30 restore the insolubility problem. Shellac films sprayed  
31 as Shellac or as Shellac salts perform similarly and do  
32 not resist acid (0.1 N HCl for two hours) then rapidly  
33 (within one hour) releases the contents of the dosage

1 unit in neutral or mildly alkaline conditions in the  
2 manner of an enteric coat. Shellac films can be produced  
3 that disintegrate between two and three hours and would  
4 appear to meet the above requirements. However Shellac  
5 films are relatively insensitive to pH and, as described  
6 above, disintegrate between two and three hours  
7 regardless of the solution acidity or alkalinity and  
8 instead behave as erodible films which dissolve as a  
9 function of time.

10

11 Another material that is approved for food use and has  
12 been suggested or used as an enteric coating material is  
13 Zein. Zein is a prolamine obtained from corn and is used  
14 as a tablet binder or tablet coating agent. It has in  
15 the past been used as an enteric coating material. It is  
16 insoluble in water and most of the common organic  
17 solvents including both acetone and ethanol. It can be  
18 dissolved and sprayed as a film from propylene  
19 glycol/water solutions but due to the high propylene  
20 glycol content (typically over 65%) and high boiling  
21 point of propylene glycol its use suffers from technical,  
22 solution cost and environmental consideration problems.

23

24 Zein coats form a very weak film in acid which, in tests,  
25 fail to resist 0.1 N HCl for two hours. The coating does  
26 not dissolve in neutral or mildly alkaline conditions and  
27 therefore does not perform as a satisfactory enteric  
28 coating material. It again has been suggested that the  
29 Zein coat is digested rather than dissolves in the  
30 intestine, which is a rather unusual, and non-enteric,  
31 release mechanism.

32

1 It can be seen that it would be beneficial to provide an  
2 enteric coating material that overcomes the problems of  
3 the prior art.

4

5 It is an object of the present invention to provide an  
6 enteric coating material.

7

8 According to a first aspect of the present invention  
9 there is provided an enteric coating formulation  
10 comprising shellac and sodium alginate.

11

12 Preferably the Shellac is in aqueous form.

13

14 Preferably the formulation is edible.

15

16 Most preferably the formulation comprises materials that  
17 are approved for food use.

18

19 Optionally, there is 10-90% Shellac in the formulation.

20

21 Optionally, there is 10-90% sodium alginate in the  
22 formulation.

23

24 Preferably, there is equal quantities of Shellac and  
25 sodium alginate in the formulation.

26

27 Most preferably, the Shellac is in aqueous salt form.

28

29 Preferably, the formulation is in the form of a spray  
30 solution or a suspension.

31

32 Optionally, the formulation can be applied to a dosage  
33 unit in the form of a spray.

1  
2 Optionally, the pH of the formulation may be adjusted to  
3 maintain a useable solution / suspension.

4  
5 Optionally, the pH of any of the components of the  
6 formulation may be adjusted to maintain a useable  
7 solution / suspension.

8  
9 Preferably, a low viscosity grade of sodium alginate is  
10 used.

11  
12 Optionally, a plasticiser may be added to the  
13 formulation.

14  
15 According to a second aspect of the present invention  
16 there is provided a dosage unit comprising enteric outer  
17 film which is itself comprises Shellac and sodium  
18 alginate.

19  
20 According to a third aspect of the present invention  
21 there is provided a method for preparing an enteric  
22 coating comprising the steps mixing an aqueous solution  
23 of an alkali salt of Shellac with an aqueous solution of  
24 sodium alginate.

25  
26 In order to provide a better understanding of the present  
27 invention the invention will be described by way of  
28 example only and with reference to the following drawing  
29 in which Figure 1 shows a cross section of a dosage unit  
30 comprising an enteric coating according to the present  
31 invention.

32

1 Sodium alginate is GRAS listed and recognised as a food  
2 additive in Europe. It is used as a stabilising agent,  
3 suspending agent, tablet and capsule disintegrant, tablet  
4 binder and viscosity increasing agent. However, until now  
5 it has never been suggested as an enteric coating  
6 material. It is described in the art as being insoluble  
7 below pH 3 and slowly soluble in neutral or alkaline  
8 solution and forms aqueous solutions.

9  
10 Neither Shellac, in free acid or alkaline salt form, nor  
11 sodium alginate form films that are acid resistant (where  
12 an acid is 0.1 N HCl) and dissolve or disintegrate in  
13 neutral/mildly alkaline conditions (ie pH 6.8 buffer), ie  
14 neither performs the function of an enteric coat.

15  
16 In the present invention a mixture of Shellac, in the  
17 aqueous salt form, and sodium alginate can be mixed  
18 together in a formulation to form a film that resists  
19 acid but disintegrates in neutral/mildly alkaline  
20 conditions. This film has the properties of an enteric  
21 film and is entirely composed of food use approved  
22 materials. Therefore, it is usable by the food and  
23 nutraceutical industry to coat non-pharmaceutical (ie  
24 non-licensed) dosage units where an enteric coating may  
25 still be of great use.

26  
27 As a preliminary step Shellac may be formed into a  
28 solution of the alkali salt using standard techniques  
29 known in the art. An example of such a technique is to  
30 heat Shellac in water, with stirring to 50-55°C then,  
31 after dissolution of the Shellac and the addition of 10%  
32 solution of ammonium hydrogen carbonate, the mixture is  
33 heated to 60°C, with stirring for a further 30 minutes.

1 On cooling the Shellac remains in solution as the alkali  
2 salt.

3

4 The coating formulation is formed by mixing an aqueous  
5 solution of an alkali salt of Shellac with an aqueous  
6 solution of sodium alginate. The content of either  
7 material may vary from 10% of one to 90% and will still  
8 demonstrate enteric properties in the film formed. Most  
9 preferably the constituents are present in equal  
10 quantities. The pH of the mixture, or either component  
11 within the mixture, may be adjusted to maintain a useable  
12 solution or suspension.

13

14 The aqueous solution of the alkali Shellac salt may be  
15 formed from Shellac as part of the preliminary process  
16 using methods known in the art.

17

18 It is also worth noting that sodium alginate is  
19 commercially available as different grades which form  
20 solutions of significantly different viscosities.  
21 Preferably, in this case, a low viscosity grade of sodium  
22 alginate will be used. The preferred viscosity of sodium  
23 alginate is 200-300cps, defined as the viscosity of a 3%  
24 solution in water with sequestering agent

25

26 A plasticiser may be added to the formulation to modify  
27 the flexibility of the film formed to suit the dosage  
28 requirements. Examples of plasticisers are triethyl  
29 citrate, polyethylene glycol, polypropylene glycol and  
30 glycerin monostearate. The plasticisers would typically  
31 be added in the 5-25% range. The aqueous Shellac/sodium  
32 alginate solution or suspension can, at a suitable  
33 concentration which is spraying system dependent, be

1 sprayed using commercial equipment by personnel skilled  
2 in the art to form films on dosage units.

3

4 It can be seen that the present invention has a number of  
5 benefits over the prior art and up until now this  
6 combination of materials has not been known to produce a  
7 film that has enteric properties and is acceptable for  
8 food use. As none of the materials themselves perform in  
9 an enteric manner it is somewhat surprising to find that  
10 the combination of material produces a film that shows  
11 enteric properties, a property possessed by neither of  
12 the components.

13

14 It should be noted that the embodiments disclosed above  
15 are merely exemplary of the invention which may be  
16 embodied in many different forms. Therefore, details  
17 disclosed herein are not to be interpreted as limiting  
18 but merely as a basis for claims and for teaching one  
19 skills in the art as to the various uses of the present  
20 invention in any appropriate manner.
